

Application area:

# Smoothing

Pos. 1 & 2

# PRODIAM

electroplated wheels

This kind of tool (wheel) executes the marble **smoothing** (POS. 1) and the marble, granite and synthetic finishing (POS. 2), removing the slab's roughness and **maintaining the geometry of the profile** even on **very hard materials like the granite one**. **This result is due to the use of materials such as the steel core upon which we lay the diamond powder through an electrolytic process**. The use of this wheel is very important before passing to the rectifying phase.

The main characteristics are:

- ▶ **Perfect geometry of the profile:**  
thanks to the inalterability of the profile until the total wear
- ▶ **Long abrasive power life**
- ▶ **Excellent preparation** to the finishing phase
